

8.2 - AA Similarity

Bellwork - Find the value of x .

1.

$x = 56^\circ$

2.

$x = 19^\circ$

3.

122°

4.

$x = 90^\circ$

Theorem 8.3 Angle-Angle (AA) Similarity Theorem

If two angles of one triangle are congruent to two angles of another triangle, then the two triangles are similar.

If $\angle A \cong \angle D$ and $\angle B \cong \angle E$, then $\triangle ABC \sim \triangle DEF$.

Proof p. 428

Determine whether the triangles are similar. If they are, write a similarity statement. Explain your reasoning.

$\angle D \cong \angle G$

$26^\circ + 90^\circ + m\angle E = 180$

$m\angle E = 64^\circ$

because of Δ Sum Thrm.

so, $\angle E \cong \angle H$

So $\triangle CDE \sim \triangle KGH$

8.2 - AA Triangle Similarity.notebook

Show that the two triangles are similar.

a. $\triangle ABE \sim \triangle ACD$

$\angle A \cong \angle A$ by Reflex. POC
 $m\angle ABE = m\angle C = 52^\circ$
 $\triangle ABE \sim \triangle ACD$, by AA \sim Thrm.

b. $\triangle SVR \sim \triangle UVT$

$\angle S \cong \angle U$, Alt Int. \angle 's Thrm.
 $\angle SVR \cong \angle UVT$ Vert. \angle 's \cong Thrm.
 So, $\triangle SVR \sim \triangle UVT$
 by Δ Sim. Thrm.

3. WHAT IF? Suppose that $\overline{SR} \parallel \overline{TU}$ in Example 2 part (b). Could the triangles still be similar? Explain.

No, because you can't prove $\angle S \cong \angle U$ or $\angle R \cong \angle T$

Show that the triangles are similar. Write a similarity statement.

1. $\triangle FGH$ and $\triangle RQS$

$\angle F \cong \angle R$ and $\angle G \cong \angle Q$
 So, $\triangle FGH \sim \triangle RQS$
 because AA Sim. Thrm.

2. $\triangle CDF$ and $\triangle DEF$

$m\angle CDF + 32 = 90$
 $m\angle CDF = 58^\circ$
 $\angle CDF \cong \angle DEF$ and
 $\angle CFE \cong \angle DFE$

So, $\triangle CDF \sim \triangle DEF$

A flagpole casts a shadow that is 50 feet long. At the same time, a woman standing nearby who is 5 feet 4 inches tall casts a shadow that is 40 inches long. How tall is the flagpole to the nearest foot?

$\frac{40}{600} = \frac{60}{X}$
 $X \cdot 36,000 = 40X$
 $X = 900 \text{ in.}$
75 ft.

40 600 50(12) Not drawn to scale

4. WHAT IF? A child who is 58 inches tall is standing next to the woman in Example 3. How long is the child's shadow?

$\frac{60}{58} = \frac{40}{X}$
 $2320 = 60X$
 $38\frac{2}{3} = X$
38 2/3 inches

5. You are standing outside, and you measure the lengths of the shadows cast by both you and a tree. Write a proportion showing how you could find the height of the tree.

Sample, $\frac{\text{my height}}{\text{tree height}} = \frac{\text{my shadow}}{\text{tree shadow}}$

8.2 - AA Triangle Similarity.notebook

Exit Ticket: One triangle has angles of 18° and 96° , and a second triangle has angles of 56° and 96° . Are the triangles similar? Explain.

The Δ 's are not similar because
2 out of the 3 angles are not congruent.
